

Credit Card Financial Dashboard — Power BI

An interactive Power BI project analyzing credit card customer and transaction data, covering revenue, customer demographics, spending behavior, and card performance for FY2023.

Dashboards

1. **Credit Card Customer Report** — customer demographics, income, job, education, and revenue breakdowns
2. **Credit Card Transaction Report** — transaction volume, spend categories, card tiers, and channel usage

Key Metrics

Metric	Value
Total Revenue	₹57M
Total Interest Earned	₹8M
Total Income (customer base)	₹588M
Total Transaction Amount	₹46M
Total Transaction Count	667K
Customer Satisfaction Score (CSS) 3.19 / 5	

Key Insights

1. Revenue is heavily concentrated in the Blue card tier

Blue cardholders drive **~83% of total revenue** (₹4.72 crore of ₹5.65 crore), far outpacing Gold, Silver, and Platinum combined. This points to a large upsell opportunity — moving high-activity Blue customers into premium tiers, or improving Platinum's value proposition since it currently contributes less than 2% of revenue despite typically having the highest spending power.

2. Interest income is a meaningful revenue driver

At ₹8M, interest earned represents **~14% of total revenue** — a significant secondary income stream beyond transaction fees, concentrated mostly in the Blue and Businessman segments.

3. Digital adoption is low

Only **6.2% of transaction value** comes from Online channels, versus 63.1% Swipe and 30.7% Chip. This signals an opportunity to promote digital/online payments — both for customer convenience and stronger fraud protection (chip transactions are inherently more secure than swipe).

4. Businessmen are the most valuable customer segment

Despite not being the largest group by customer count, the **Businessman segment generates the highest revenue (₹1.77 crore) and interest earned (₹25.8L)** of any job category — making it the top priority for retention and premium product targeting. Retirees generate the least (₹46L), consistent with lower transaction activity.

5. Q4 shows higher-value, lower-frequency spending

Quarterly revenue grew steadily (₹14.0M → ₹13.8M → ₹14.2M → ₹14.5M), but transaction count peaked in Q3 (173.2K) and *dropped* in Q4 (164.2K) even as revenue rose. This suggests **fewer but higher-value transactions in Q4** — likely holiday season big-ticket spending.

6. Bills, Entertainment, and Fuel are the top spend categories

Bills lead at ₹14M, followed by Entertainment and Fuel (₹10M each). Travel is the lowest spend category (₹6M) — a potential opportunity for targeted travel rewards or cashback campaigns to grow an underperforming category.

7. Income and education show a gender revenue gap

In the High income group, male customers contribute **₹21M vs ₹7M for female customers** — a 3x gap that's worth deeper investigation (could reflect underlying income distribution in the customer base rather than spending behavior differences).

8. Revenue is geographically diversified

The top 5 states (TX, NY, CA, FL, NJ) are fairly evenly split, with no single state dominating — indicating a nationally distributed customer base rather than regional concentration risk.

Tools Used

- PostgreSQL Server Power BI Desktop (data modeling, DAX measures, dashboard design)

Files

- Credit_card_customer_report.pdf — Customer demographics dashboard
- Credit_card_transaction_report.pdf — Transaction & spend behavior dashboard

Dashboard analysis based on FY2023 credit card customer and transaction data.
